- Dielectrics
- Thick and thin film resistors
- Specialized devices
  - Piezoelectrics 
  - Pyroelectrics

# Conductivity Behavior

$$\sigma = n(q)v$$

$$n \propto e^{-\frac{E_G}{k_B T}}$$

$$D \propto e^{-\frac{E_a}{k_B T}}$$

# Conductivity Behavior

**Table 2.3** Conductivity characteristics of the various classes of material

<i>Material class</i>	<i>Example</i>	<i>Conductivity level</i>	<i><math>d\sigma/dT</math></i>	<i>Carrier type</i>
Metals	Ag, Cu	High	Small, negative	Electrons
Semiconductors	Si, Ge	Intermediate	Large, positive	Electrons
Semi-insulators	ZrO <sub>2</sub>	Intermediate	Large, positive	Ions or electrons
Insulators	Al <sub>2</sub> O <sub>3</sub>	Very low	Very large, positive	Ions or electrons; frequently 'mixed'

electrons and holes

$$\epsilon_T = \epsilon_{\text{THERMAL}} + \epsilon_{\text{defect}} + \epsilon_{\text{impurity}}$$

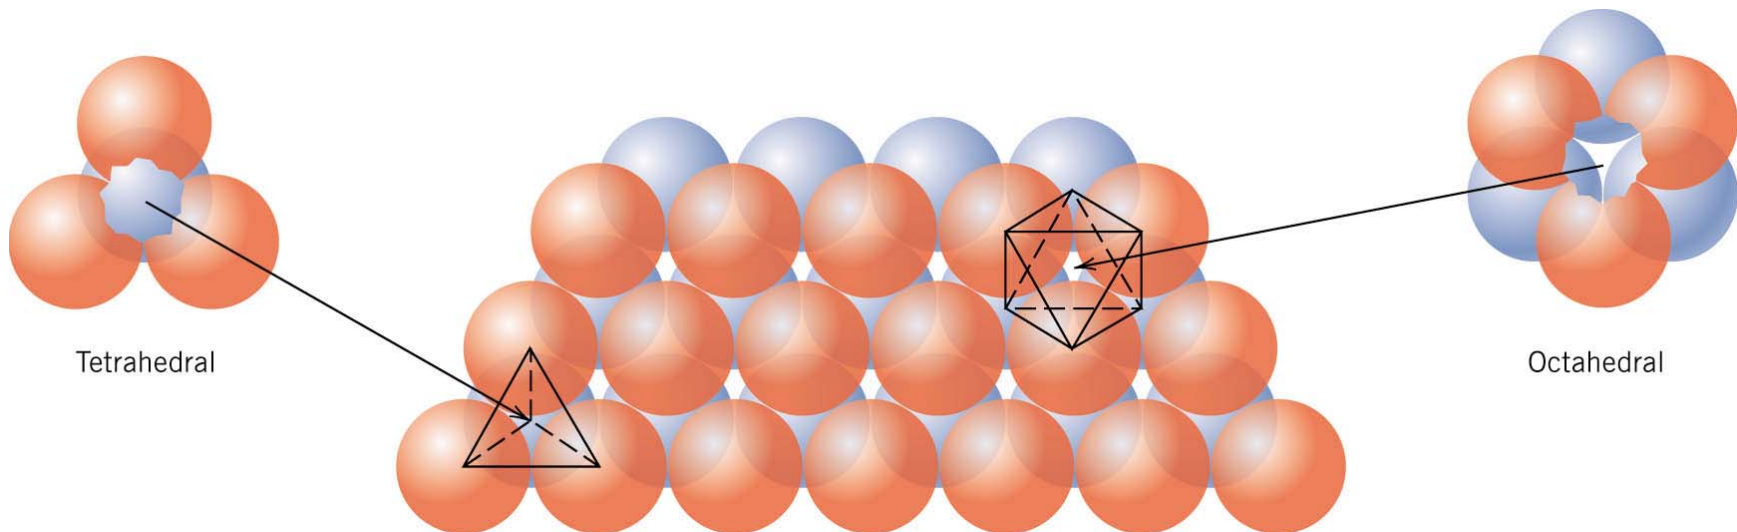

**Table 7.1** Some common electrical ceramics.

Ceramic		Crystalline phases	Glassy phase = SiO <sub>2</sub> +	Made from
Porcelain	Triaxial	Quartz (SiO <sub>2</sub> ) Mullite (Al <sub>2</sub> O <sub>3</sub> ) <sub>2</sub> (SiO <sub>2</sub> ) <sub>3</sub>	Al, K	45% clay e.g. kaolin (China clay) Al <sub>2</sub> (Si <sub>2</sub> O <sub>5</sub> )(OH) <sub>4</sub> 35% flux e.g. feldspar KAlSi <sub>3</sub> O <sub>8</sub> 20% filler e.g. quartz: flint or sand SiO <sub>2</sub>
	Aluminous	Al <sub>2</sub> O <sub>3</sub>	Al, Mg	95% alumina Al <sub>2</sub> O <sub>3</sub> 5% talc (steatite) Mg <sub>3</sub> (Si <sub>2</sub> O <sub>5</sub> ) <sub>2</sub> (OH) <sub>2</sub> (very similar to clay) or as for triaxial porcelain with flint replaced by alumina
Steatite		Enstatite (MgO)(SiO <sub>2</sub> ) (mainly)	Mg	15% clay 83% talc 2% chalk (CaCO <sub>3</sub> )
Cordierite		Cordierite (MgO) <sub>2</sub> (Al <sub>2</sub> O <sub>3</sub> ) <sub>2</sub> (SiO <sub>2</sub> ) <sub>5</sub>	Mg	80% clay 20% talc
Alumina		Alumina (Al <sub>2</sub> O <sub>3</sub> )	—	Bauxite (Al <sub>2</sub> O <sub>3</sub> )(H <sub>2</sub> O) <sub>2</sub>
Barium titanate		BaTiO <sub>3</sub> (= BaO-TiO <sub>2</sub> )	—	Barium carbonate (BaCO <sub>3</sub> ) and rutile (TiO <sub>2</sub> )

# Ceramic Crystal Structures

## Oxide structures

- oxygen anions much larger than metal cations
- “close packed” oxygen in a lattice (usually FCC)
- cations in the holes of the oxygen lattice

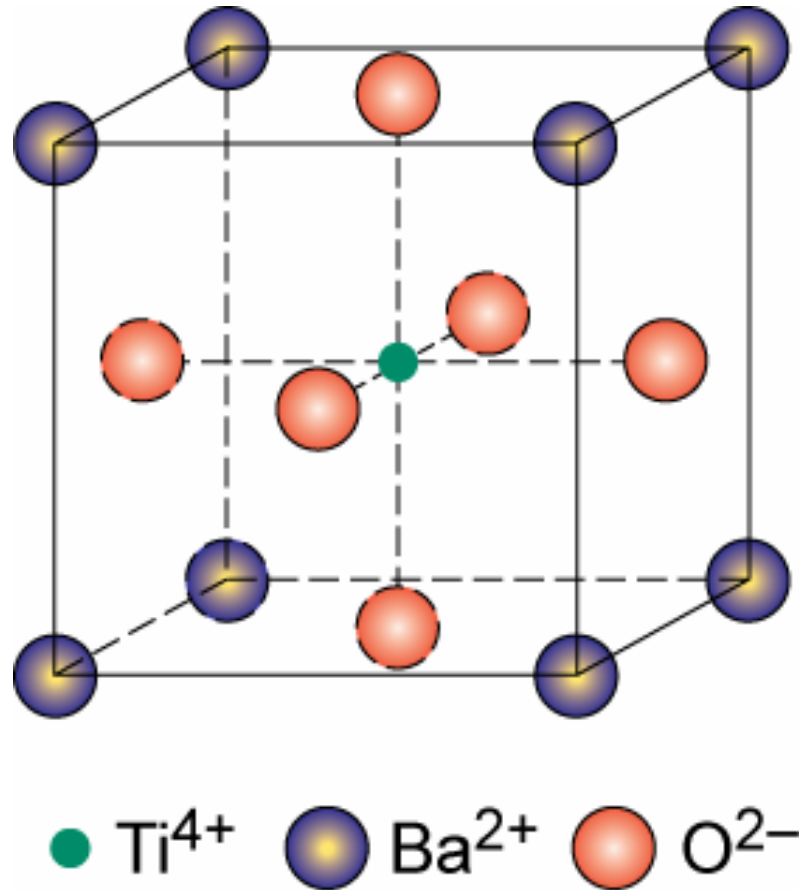

# ABX<sub>3</sub> Crystal Structures

- Perovskite

Ex: complex oxide

# Atomic Force Microscope

# Polymers

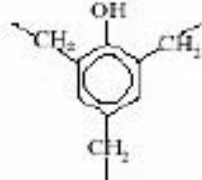

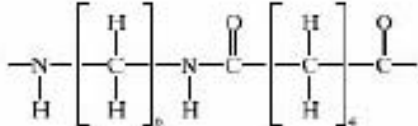

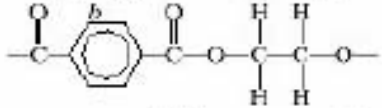

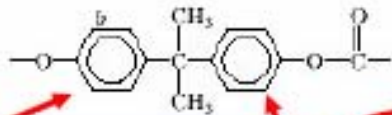

- **Polymers** are made up of large numbers of similar repeat units linked to each other by **covalent bonding**.
- Repeat units – **monomers**.
- **Polymerisation** is the process that links all monomers to large macromolecules.

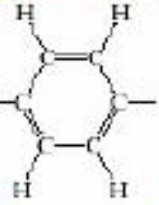

# Mer Structures for a Variety of Polymers

**Table 15.3** A Listing of Mer Structures for 10 of the More Common Polymeric Materials

Polymer	Repeating (Mer) Structure
 Polyethylene (PE)	$\begin{array}{c} \text{H} \quad \text{H} \\   \quad   \\ -\text{C} - \text{C}- \\   \quad   \\ \text{H} \quad \text{H} \end{array}$
 Polyvinyl chloride (PVC)	$\begin{array}{c} \text{H} \quad \text{H} \\   \quad   \\ -\text{C} - \text{C}- \\   \quad   \\ \text{H} \quad \text{Cl} \end{array}$
 Polytetrafluoroethylene (PTFE)	$\begin{array}{c} \text{F} \quad \text{F} \\   \quad   \\ -\text{C} - \text{C}- \\   \quad   \\ \text{F} \quad \text{F} \end{array}$
 Polypropylene (PP)	$\begin{array}{c} \text{H} \quad \text{H} \\   \quad   \\ -\text{C} - \text{C}- \\   \quad   \\ \text{H} \quad \text{CH}_3 \end{array}$
 Polystyrene (PS)	$\begin{array}{c} \text{H} \quad \text{H} \\   \quad   \\ -\text{C} - \text{C}- \\   \quad   \\ \text{H} \quad \text{C}_6\text{H}_5 \end{array}$
 Polymethyl methacrylate (PMMA)	$\begin{array}{c} \text{H} \quad \text{CH}_3 \\   \quad   \\ -\text{C} - \text{C}- \\   \quad   \\ \text{H} \quad \text{C}(=\text{O})\text{OCH}_3 \end{array}$

# An Introduction to The Classification of Polymeric Materials

# Plastic?

plastic = polymer +  
dye  
fire retardant  
filler  
etc.

# Polymers

# Polymer Structures

- Linear Polymers mer units are end-to-end long chains, e.g.
  - polyethylene, polyvinyl chloride, polystyrene, nylon, polyfluorocarbons
- Branched Polymers synthesized with side branches
  - chain packing is less efficient thus lower density results
- Cross-linked: covalent bonding between chains such as in *vulcanized* rubber (elastomers)

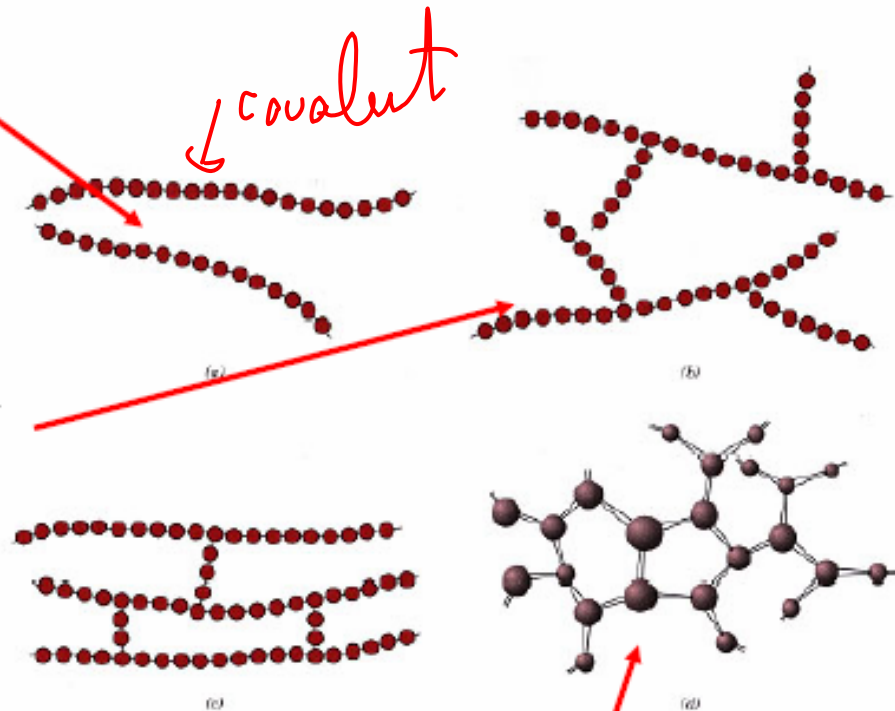

FIGURE 15.7 Schematic representations of (a) linear, (b) branched, (c) crosslinked, and (d) network (three-dimensional) molecular structures. Circles designate individual mer units.

## • Network polymers:

- 3-dimensional linking of polymer chains, e.g. epoxies and bakelite

# Classification of synthetic polymers

- Thermoplastics
- Thermosets
- Elastomers

# Thermoplastic Polymers

- *Thermoplastic* polymers soften and melt at high temperature
- fabrication is by simultaneous application of heat and pressure
- *linear or branch* type polymers are **thermoplasts**

bakelite

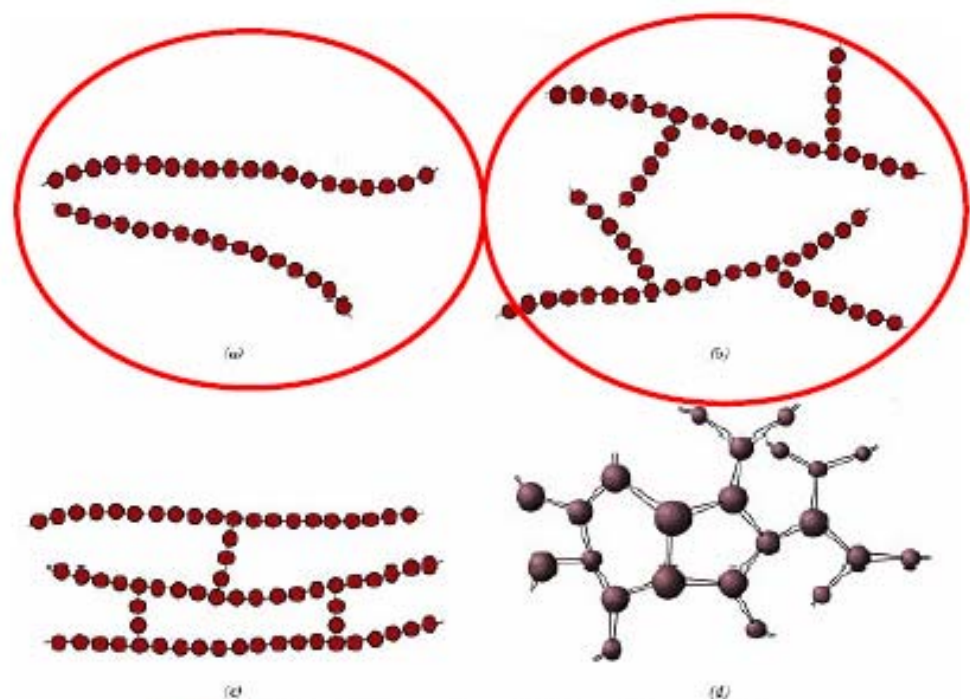

FIGURE 15.7 Schematic representations of (a) linear, (b) branched, (c) crosslinked, and (d) network (three-dimensional) molecular structures. Circles designate individual mer units.

# Thermoplastics

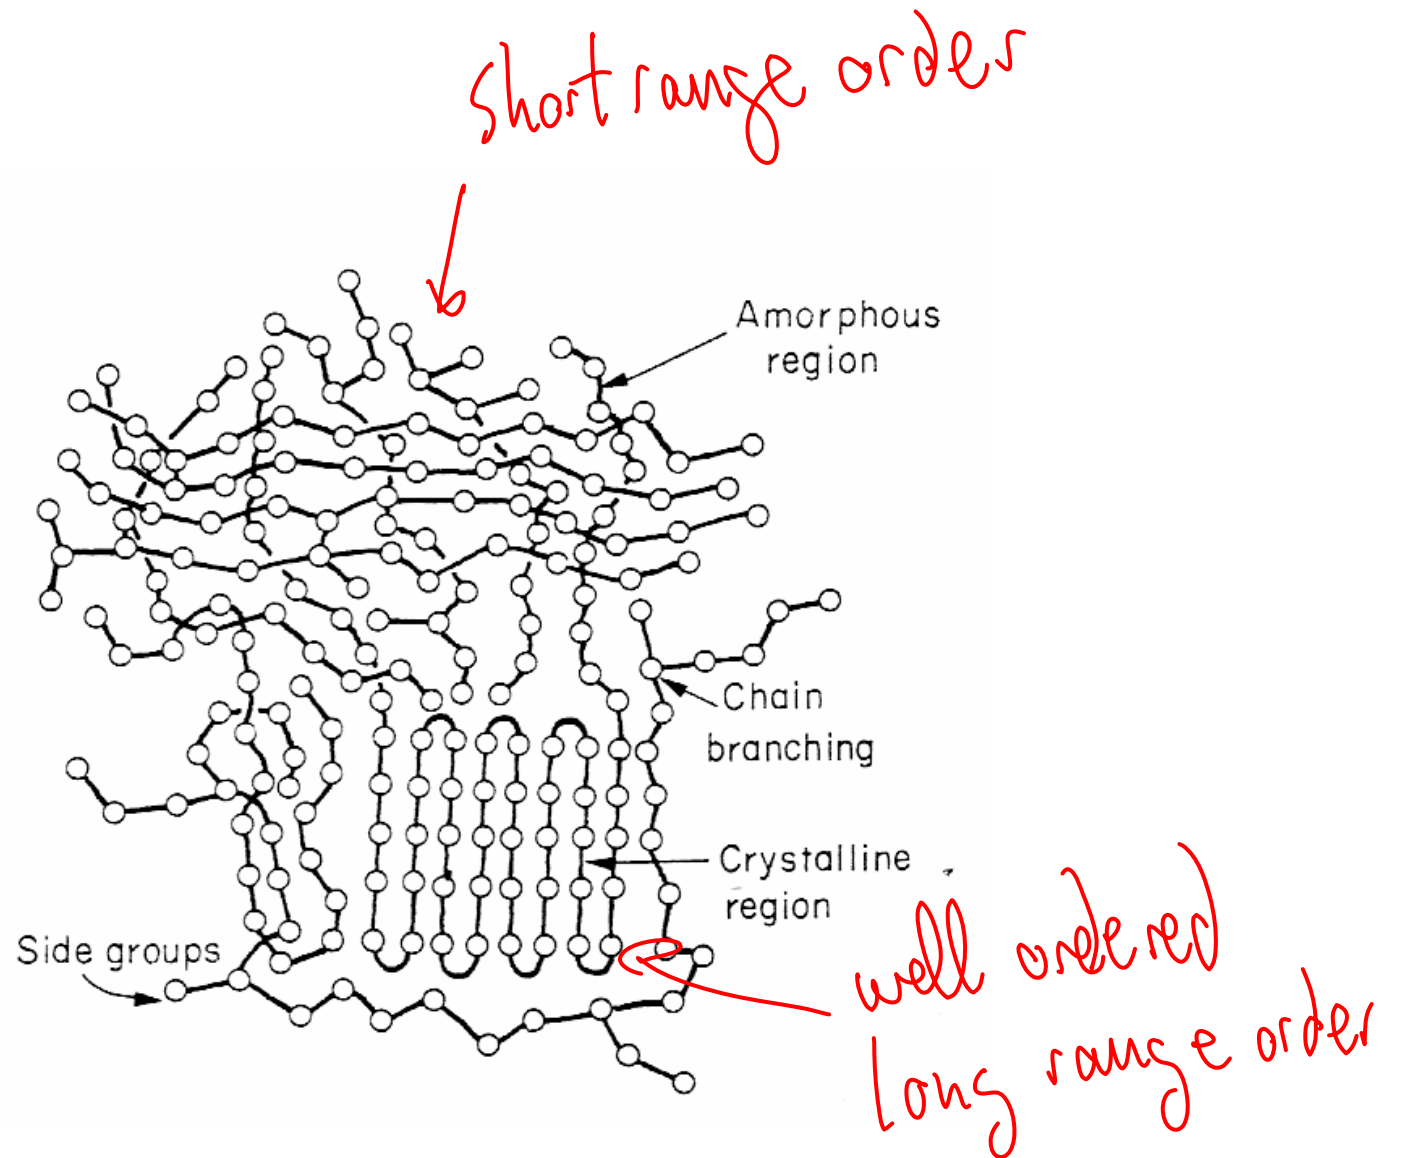

## General Structure

- Linear polymers with limited branching.
- Chemical chains are chemically separate from each other.
- No permanent links between chains, but are physically entangled.

# Thermoplastics

## General properties

- Can be amorphous and semi-crystalline.
- Can be dissolved in solvents without destroying the chemical bonds.
- Can be heated and cooled to reshape. Chains can slide past each other under heat and pressure.
- E.g. Extrusion, injection and compression moulding.

**Table 8.1** Seven common thermoplastics used in electrical and electronic engineering.

Abbreviation	Full name	Repeating group
PE*	Polyethylene	$\left[ \begin{array}{cc} \text{H} & \text{H} \\   &   \\ -\text{C} & - & \text{C}- \\   &   \\ \text{H} & \text{H} \end{array} \right]$
PVC	Poly(vinyl chloride)	$\left[ \begin{array}{cc} \text{H} & \text{H} \\   &   \\ -\text{C} & - & \text{C}- \\   &   \\ \text{H} & \text{Cl} \end{array} \right]$
PP	Polypropylene	$\left[ \begin{array}{cc} \text{H} & \text{H} \\   &   \\ -\text{C} & - & \text{C}- \\   &   \\ \text{H} & \text{CH}_3 \end{array} \right]$
PS	Polystyrene	$\left[ \begin{array}{cc} \text{H} & \text{C}_6\text{H}_5 \\   &   \\ -\text{C} & - & \text{C}- \\   &   \\ \text{H} & \text{H} \end{array} \right]$
ABS	Acrylonitrile-butadiene-styrene copolymer	(mixture of polymers)
SAN	Styrene-acrylonitrile copolymer	
PA†	Nylon	<p>e.g.</p> $\text{--}[(\text{CH}_2)_m\text{--}\underset{\text{H}}{\underset{ }{\text{N}}}\text{--}\overset{\text{O}}{\overset{  }{\text{C}}}\text{--}(\text{CH}_2)_n\text{--}\overset{\text{O}}{\overset{  }{\text{C}}}\text{--}\underset{\text{H}}{\underset{ }{\text{N}}}\text{--}]\text{--}$ <p>where <math>m = 4, n = 6 \Rightarrow</math> nylon 6,6</p>

\* LDPE, HDPE: Low Density PolyEthylene, High Density Polyethylene.

† PA6, PA66, PA610: Nylon 6, Nylon 66, Nylon 610.

**Table 8.5** Typical applications for some common plastics used in electrical and electronic engineering.

Polymer	Typical applications
PE	High voltage and/or high frequency cable insulation
PVC	Domestic cable insulation
PP	Housings for simple household appliances, e.g. coffee makers
PS	Alternative to ABS; high frequency insulation; lamp shades, diffusers
ABS	High quality housings for: radio, TV, video recorders/players, washing machines, telephones, vacuum cleaners, hairdriers
SAN	(Transparent) windows in washing machines; battery casings
PA	Plugs and sockets; terminal strips; switch bases; electric tool housings; coin box telephones

FR4

# Thermosetting Polymers

- *Thermosets* are permanently hard and do not soften upon subsequent heating
- during fabrication there is a reaction between two components which produces a 3-dimensional *network polymer*
- 10-50% of the chain mers are cross-linked
- heating to very high temperature causes severance of cross-links and *polymer degradation*, not melting

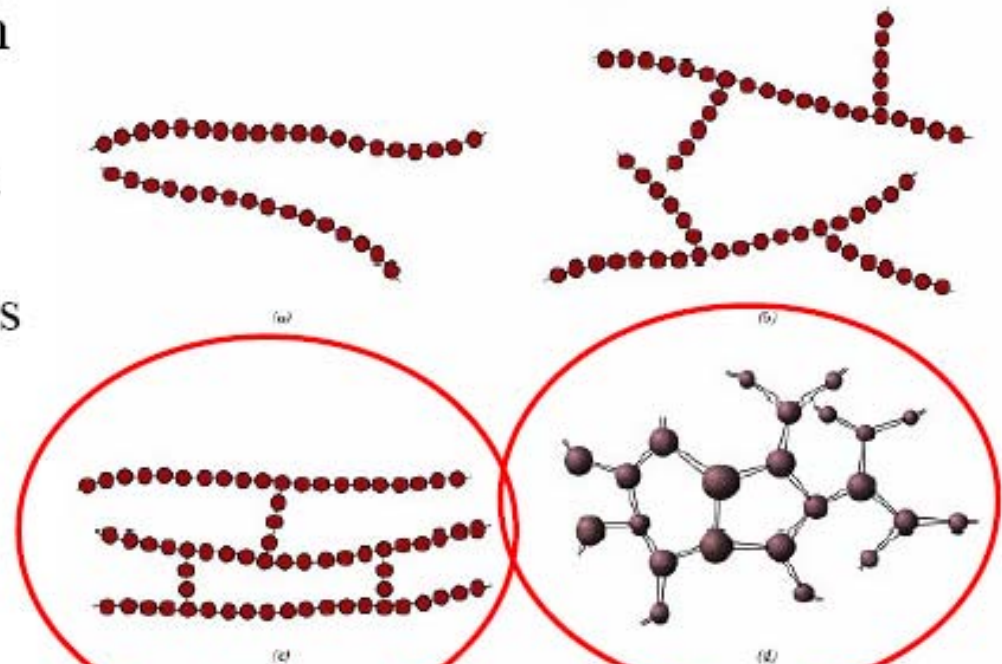

FIGURE 15.7 Schematic representations of (a) linear, (b) branched, (c) crosslinked, and (d) network (three-dimensional) molecular structures. Circles designate individual mer units.

# Thermosets

## General structure

- Also known as crosslinked or network polymers.
- Consist of network interconnected chains whose positions are fixed to neighbours.
- Permanently connected either directly or through short bridging chains.
- Up to 50% of chains are crosslinked

# Thermosets

## General Properties

- Good thermal and dimensional stability.
- Solvent resistant- does not dissolve, but can swell.
- Good stiffness, low strain to failure.
- Non-reversible polymers.
- Heat and pressure resistant. Crosslinks prevent large scale reorganisation of the chains.
- Polymerisation and shaping occurs at the same time. E.g. Casting.

# Elastomers

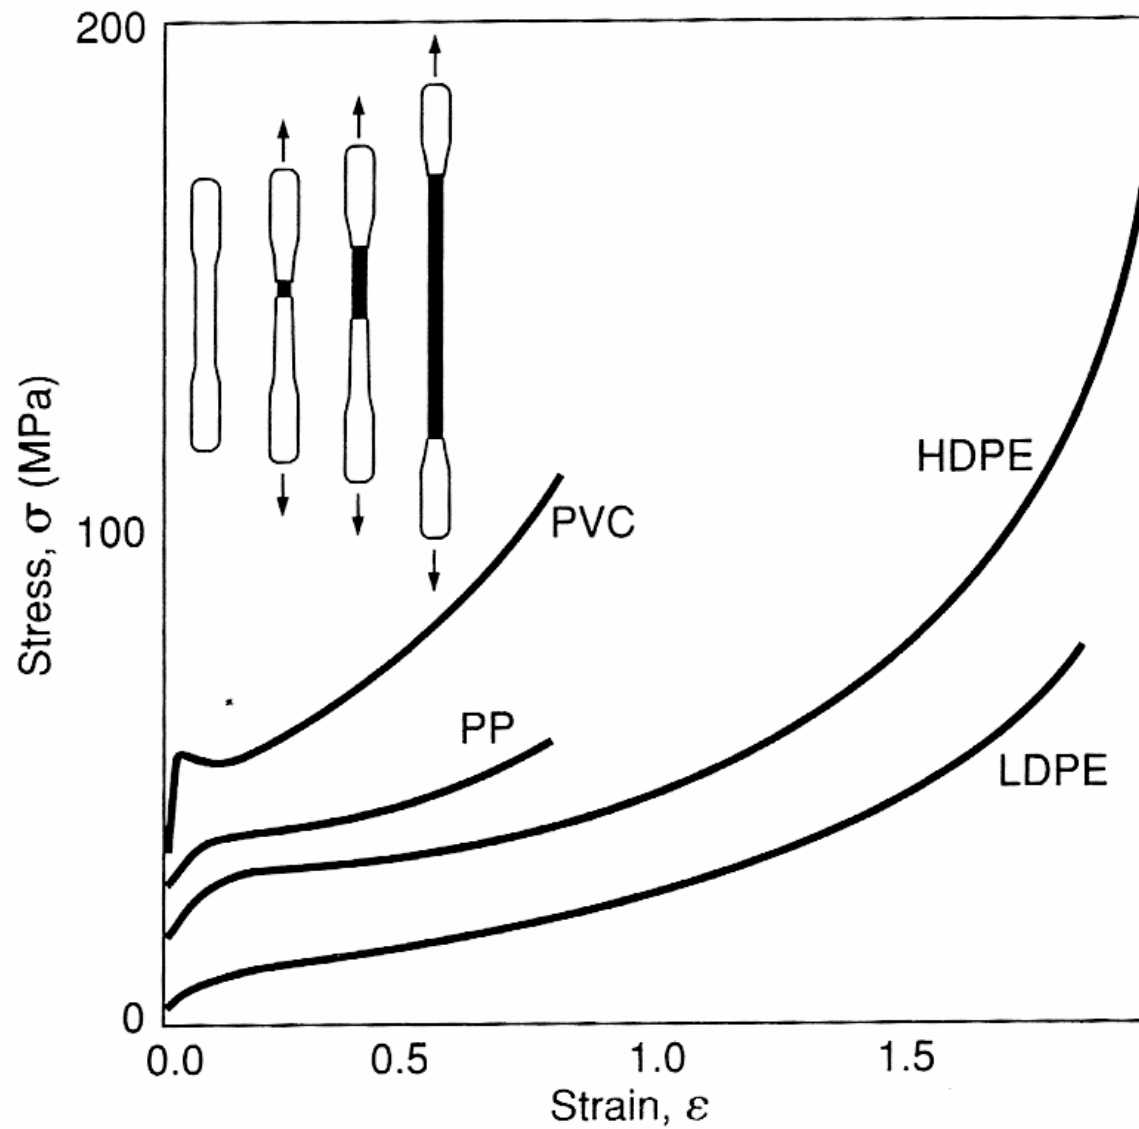

## General Structure

- Linear polymer chains that are lightly cross-linked.
- Large free volume. Atoms have large local freedom to vibrate, twist and rotate.
- Above their glass transition temperature.
- Synthetic elastomers modelled on Natural Rubber with polydienes with  $C=C$  in chain to permit vulcanisation.

# Elastomers

## General properties

- Amorphous.
- Soft and flexible.
- Chains do not entirely slide past each other due to chemical crosslinks.
- Capacity to undergo large rapidly recoverable deformation.
- They have high modulus and strength under high strain levels.

**Fig. 8.9** Tensile test curves for a variety of polymers at room temperature. (From *Engineering materials science* by M. Ohring, courtesy of Academic Press, Inc.)
