

18.12 (a) This portion of the problem asks that we calculate, for silver, the number of free electrons per cubic meter ( $n$ ) given that there are 1.3 free electrons per silver atom, that the electrical conductivity is  $6.8 \times 10^7 (\Omega\text{-m})^{-1}$ , and that the density ( $\rho'_{\text{Ag}}$ ) is  $10.5 \text{ g/cm}^3$ . (Note: in this discussion, the density of silver is represented by  $\rho'_{\text{Ag}}$  in order to avoid confusion with resistivity which is designated by  $\rho$ .) Since  $n = 1.3N_{\text{Ag}}$ , and  $N_{\text{Ag}}$  is defined in Equation 4.2 (and using the atomic weight of Ag found inside the front cover—viz 107.87 g/mol), then

$$\begin{aligned} n &= 1.3N_{\text{Ag}} = 1.3 \left[ \frac{\rho'_{\text{Ag}} N_A}{A_{\text{Ag}}} \right] \\ &= 1.3 \left[ \frac{(10.5 \text{ g/cm}^3)(6.023 \times 10^{23} \text{ atoms/mol})}{107.87 \text{ g/mol}} \right] \\ &= 7.62 \times 10^{22} \text{ cm}^{-3} = 7.62 \times 10^{28} \text{ m}^{-3} \end{aligned}$$

(b) Now we are asked to compute the electron mobility,  $\mu_e$ . Using Equation 18.8

$$\begin{aligned} \mu_e &= \frac{\sigma}{n |e|} \\ &= \frac{6.8 \times 10^7 (\Omega\text{-m})^{-1}}{(7.62 \times 10^{28} \text{ m}^{-3})(1.602 \times 10^{-19} \text{ C})} = 5.57 \times 10^{-3} \text{ m}^2/\text{V}\cdot\text{s} \end{aligned}$$
