

### Electrical Resistivity of Metals

18.13 We want to solve for the parameter  $A$  in Equation 18.11 using the data in Figure 18.37. From Equation 18.11

$$A = \frac{\rho_i}{c_i (1 - c_i)}$$

However, the data plotted in Figure 18.37 is the total resistivity,  $\rho_{\text{total}}$ , and includes both impurity ( $\rho_i$ ) and thermal ( $\rho_T$ ) contributions (Equation 18.9). The value of  $\rho_T$  is taken as the resistivity at  $c_i = 0$  in Figure 18.37, which has a value of  $1.7 \times 10^{-8}$  ( $\Omega\text{-m}$ ); this must be subtracted out. Below are tabulated values of  $A$  determined at  $c_i = 0.10$ ,  $0.20$ , and  $0.30$ , including other data that were used in the computations. (*Note:* the  $c_i$  values were taken from the upper horizontal axis of Figure 18.37, since it is graduated in atom percent zinc.)

$c_i$	$1 - c_i$	$\rho_{\text{total}}$ ( $\Omega\text{-m}$ )	$\rho_i$ ( $\Omega\text{-m}$ )	$A$ ( $\Omega\text{-m}$ )
0.10	0.90	$4.0 \times 10^{-8}$	$2.3 \times 10^{-8}$	$2.56 \times 10^{-7}$
0.20	0.80	$5.4 \times 10^{-8}$	$3.7 \times 10^{-8}$	$2.31 \times 10^{-7}$
0.30	0.70	$6.15 \times 10^{-8}$	$4.45 \times 10^{-8}$	$2.12 \times 10^{-7}$

So, there is a slight decrease of  $A$  with increasing  $c_i$ .
